

SAVING-AND-INVESTMENT BALANCE IN OPEN ECONOMY

The aim of the article is examination of some theoretical hypothesizes and analysis of the real ratio between saving and investment in modern economy and its depending on level of economic development of the countries in quashing. Thirty countries with high, middle and low level of development were selected (ten countries in every group).

The article is dedicated to analysis of the correlation of the savings and investment as condition of balancing economy. It is discovered that shaping the balance of the savings and investment in condition of the open end economic systems cannot be provided only internal factors. The analysis of the deflections of the investment part in GDP from the saving part has shown their crowd relationship with factor of the net export. The countries, where investment is more saving, as a rule, have a negative balance of the foreign trade; extra saving corresponds with positive value of the net export. It is proved that an achievement of the balance of the saving, on the one hand, and amounts investment and net export, on the other hand, is condition of balancing of the open end economy.
