

**TYPOLOGY OF ECONOMIC GROWTH FACTORS: THEORETICAL AND
METHODOLOGICAL ASPECTS**

The article highlights the issue of typologization of economic growth factors. General theoretical significance of the typologization of economic growth factors lies in the ability to explore the nature of economic growth, reveal potential ties between the groups of factors and identify specific characteristics of the individual factors.

The study of evolutionary views on the system of economic growth factors leads us to the conclusion that the problem of economic growth and its factors has been touched upon, in one way or another, by representatives of all economic schools, with their focus on specific factors as the most important factor in economic growth.

The analysis has revealed the place of non-economic factors in the system factors of economic growth. Economic and non-economic factors cannot be considered in isolation from each other since factors effecting economic growth represent an integral system consisting of interconnected elements. Besides, it should be noted that these factors can not only supplement each other, but also overlap each other, which, finally determines the vector of economic growth.

The review of the existing theoretical approaches to the factors of economic growth allowed the author to provide the flowchart that systemizes the main approaches to the classification of economic growth factors. The flowchart demonstrates that typology of growth factors can break down into the variety of classification features. Within some time and special frames, economic growth factors do not appear in all their diversity, but shape a certain set of factors which should be considered as a dynamic, rather than static system.

Such a system can be dismembered in different ways, depending on a classification feature, which suggests that the system is multidimensional.
